

Jay-QuartzPCI Interface Enhancement

This is a standalone .exe file to allow mouse usages on Quartz-PCI Software, under the default Lam corporate laptop settings.

The code is based on [Window Messages](#) and by remapping the limited shortcut keys offered within Quartz-PCI.

Note: Since the code contains a few key-remaps, if there are any third-party keyboard and/or mouse enhancements installed (e.g: [Microsoft Mouse](#) or [Logitech Setpoint](#)), some commands might not work properly.

For any questions/inquiries, feel free to email: jay.cho@lamresearch.com

Best regards,
Jay

Current Version: Version 1.1

Lastly Updated on : 11/09/2015

Latest Version: 1.1

Tested on Windows 7 and Quartz PCI Version 9

- * ? : Help / Show Available Commands Again

Instruction

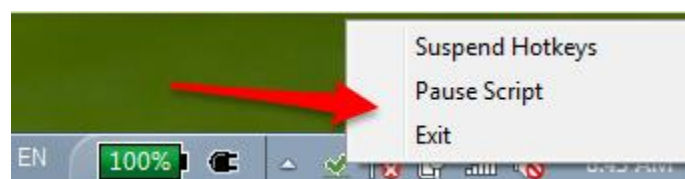

- Unzip the attached .zip file for .exe file
- Run the .exe file. An info box will pop up with a **green check mark icon** (✓) on the tray bar indicating the program has been executed:

- Now the commands listed above should be active on Quartz-PCI.

Notes:

- To terminate the program, right click on the tray icon and press 'Exit'
